PROJECT DOCUMENTATION

Import Data using Transform Maps (Spreadsheet)

Team ID	SWTID-2026-2550
Team Title	Import Data using Transform Maps (Spreadsheet)
Date	29/09/2026
Platform	ServiceNow

1. Project Overview

- Describe the ServiceNow project for importing spreadsheet data into a target table using Import Sets and Transform Maps.
- Explain the purpose of the import process, including data validation, field mapping, transformation, and record creation or update.

2. Project Architecture

- **Source:** Spreadsheet (CSV/Excel) containing the required records.
- **Import Set:** Temporary staging table used to load the spreadsheet data into ServiceNow.
- **Transform Map:** Defines how source fields are mapped and transformed into the target table.
- **Target Table:** The ServiceNow table where the transformed records are inserted or updated.

3. Data Import Design

- **Spreadsheet Preparation:** Prepare the spreadsheet with valid column headers and required data.
- **Import Set Configuration:** Create or select the appropriate Import Set table.
- **Field Mapping:** Map source spreadsheet columns to corresponding target-table fields.
- **Transformations:** Apply field maps, scripts, and data transformations when required.
- **Coalesce:** Configure a unique field when existing records need to be updated instead of duplicated.

4. Setup Instructions

- **Prerequisites:** ServiceNow instance access and a properly formatted spreadsheet.
- **Installation/Setup:** Create the Import Set, upload the spreadsheet, configure the Transform Map, and verify the field mappings.
- **Validation:** Check source data, mandatory fields, reference values, and transformation results before completing the import.

5. Data / Table Structure

- **Source:** Spreadsheet columns containing the incoming records.
- **Staging:** Import Set table stores the uploaded source records before transformation.

- **Target:** ServiceNow target table stores the final transformed records.
- **Mapping:** Each source field is mapped to the appropriate target field.

6. Running the Import

- Upload the spreadsheet through the ServiceNow Import Set process.
- Review the imported rows in the staging table.
- Run the configured Transform Map.
- Check the Import Set and Transform History for successful, ignored, or error records.
- Verify the final records in the target table.

7. Transform Map Documentation

- Document the Transform Map name and target table.
- List all field maps and source-to-target field relationships.
- Document coalesce fields, transform scripts, onBefore/onAfter logic, and any data validation rules.
- Include sample input data and expected transformed output.

8. Validation and Error Handling

- Validate mandatory fields and data formats before transformation.
- Review transform errors and rejected records.
- Correct invalid source data and re-run the import when necessary.
- Confirm that records are inserted or updated as intended and that duplicate records are avoided.

9. Expected Outcome

The project should successfully import spreadsheet data into ServiceNow, transform the source values according to the configured Transform Map, and create or update accurate records in the target table.
