Import Data using Transform Maps (Spreadsheet)

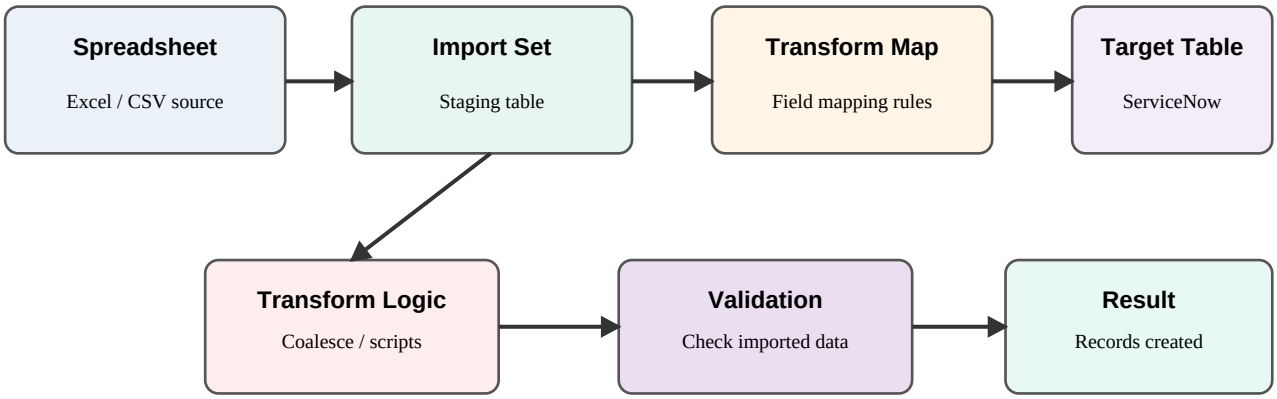
Team ID: SWTID-2026-2550 | **Date:** 29/09/2026

The solution architecture for importing spreadsheet data into ServiceNow connects the source spreadsheet with an Import Set and Transform Map. Its goals are to:

- Import structured data from a spreadsheet into ServiceNow efficiently.
- Use an Import Set to stage and validate the incoming spreadsheet records.
- Use a Transform Map to map source fields to the correct target table fields.
- Apply field mappings and transformation rules so that imported records are created accurately.
- Validate the transformed records and handle errors or rejected data before final use.

Example - Import Data using Transform Maps (Spreadsheet):

Data flow: Spreadsheet → Import Set → Transform Map → Target Table



Successful records are loaded; invalid records can be reviewed and corrected.

Step	Activity	Output
1	Upload spreadsheet and create Import Set	Staged records
2	Create Transform Map and map fields	Mapped source → target fields
3	Run transformation and validate	ServiceNow target records
